# PostgreSQL on macOS

## Install PostgreSQL using brew

```
brew install postgresql
```

List services maintained by brew

```
$ brew services list
Name      Status  User  Plist
postgresql started  lr    ...
```

If you don't want it running as service you can manually start it with

```
postgres -D /usr/local/var/postgres
```

# Backslash commands

	command
Toggle expanded display	<code>\x</code>
Toggle tuples only	<code>\t</code>
Connect to database	<code>\c db_name</code>
List databases	<code>\l</code>
Display table definition	<code>\d table_name</code>
Display triggers	<code>\dft</code>

# Cheatsheet

## Truncate/empty all tables

```
SELECT 'TRUNCATE TABLE ' || tablename || ' CASCADE;' FROM pg_tables WHERE  
tableowner='acovix_devl';
```

## Show process / query list

```
SELECT * FROM pg_stat_activity;  
  
-- active queries  
SELECT pid, age(query_start, clock_timestamp()), username, query  
FROM pg_stat_activity  
WHERE query != '<IDLE>' AND query NOT ILIKE '%pg_stat_activity%'  
ORDER BY query_start desc;
```

## Kill running query

```
SELECT pg_cancel_backend(procpid);  
  
-- kill idle query  
SELECT pg_terminate_backend(procpid);
```

## List databases size

```
select datname, pg_size_pretty(pg_database_size(datname)) from pg_database order by  
pg_database_size(datname) desc;
```

## Show all triggers from a schema

```
SELECT  
    event_object_table,  
    trigger_name,
```

```
event_manipulation,  
action_statement,  
action_timing  
FROM information_schema.triggers ORDER BY event_object_table, event_manipulation;
```

## Rename database

```
alter database old_name rename to new_name;
```

## Set database owner

```
alter database sample_name owner to david;
```

## Rename role

```
alter role role_name rename to new_role_name;
```

- set password, because after rename password is cleared

## List enum

```
select n.nspname as enum_schema,  
       t.typname as enum_name,  
       string_agg(e.enumlabel, ', ') as enum_value  
from pg_type t  
      join pg_enum e on t.oid = e.enumtypid  
      join pg_catalog.pg_namespace n ON n.oid = t.typnamespace  
group by enum_schema, enum_name
```

# Queries with IPs

## Top networks

```
CREATE TABLE ip (  
    id serial NOT NULL,  
    addr cidr NOT NULL,  
    hostname character varying(25) NOT NULL  
);  
  
SELECT * FROM ip WHERE NOT EXISTS  
    (SELECT addr FROM net n WHERE n.addr >> net.addr);
```

## Bigint to IP

```
create function bigint_to_inet(bigint) returns inet as  
$$  
select ((($1>>24&255)||'.'||($1>>16&255)||'.'||($1>>8&255)||'.'||($1>>0&255)))::inet  
$$ language sql;
```

# Dump / Restore

## Dump All Functions (to a file)

```
SELECT pg_get_functiondef(f.oid) FROM pg_catalog.pg_proc f
INNER JOIN pg_catalog.pg_namespace n ON (f.pronamespace = n.oid)
WHERE n.nspname = 'public';
```

- run `\o functions.sql` first to save the output to a file or
- use `\copy (...) to`

## Dump database

```
pg_dump -U username -h hostname databasename > dump.sql
```

## Import info existing database

```
psql -d newdb -f dump.sql
```

## Dump and Restore Sperling Database

```
pg_dump --no-owner -U sperling_prod -h mimirl.aco.net sperling_prod > dump.sql
```

```
psql -h localhost sperling_devel postgres -f dump.sql
```

# Major Version Upgrade on Debian

- make a snapshot/backup of the machine
- check the running clusters using `pg_lsclusters` command
- drop the new cluster (the one running the target version) `sudo -u postgres pg_dropcluster --stop 15 main`
- (optional) if you are ssh-ing from a macOS/Item2 the LC\_CTYPE is wrongly set
  - run `export LC_CTYPE=en_US.UTF-8 export LC_ALL=en_US.UTF-8`
- upgrade the old cluster `sudo -u postgres pg_upgradecluster 13 main`
- check the running clusters using `pg_lsclusters` command
- drop the old cluster (be sure the upgrade was successful) `sudo -u postgres pg_dropcluster 13 main`
- uninstall old postgresql packages
